HW 7

3/7/21

Question 3:

Using Facebook as social media platform example, take the scenario where a user wants to search for someone else's profile. Some tests that could be performed is:

- The profile and similar matches should show up when a corresponding input is given.
- The phrase "no results found" should show if there are no relevant answers.
- Pressing enter should generate a search query.
- Clicking on the search bar should allow the user to type their search query.

To start with the test-driven environment, these tests are given first, and then code is developed around these tests. Once a test is passed, the developer moves to the next test.
